

Construímos uma tabela para mostrar as potências:

Carga	P [watts]	Q [VAR]	S [VA]
1	100	0	$\sqrt{100^2 + 0^2} = 100$
2	200	-700 (C)	$\sqrt{200^2 + 700^2} = 728,0$
3	300	+3000 (L)	$\sqrt{300^2 + 3000^2} = 3014,96$
Total:	$P_T = 600$	$Q_T = 2300$ (L)	$S_T = \sqrt{600^2 + 2300^2} = 2376,97$

$$F_p = \frac{P_i}{S_T} = \frac{(600 \text{ W})}{2376,97 \text{ VA}} = 0,252 \text{ atrasado ou negativo}$$
